The **scaletextbullet** package

Resize the \textbullet without changing its vertical center

Oliver Beery

Version 2.0.2   28 September 2025

1 Introduction

1.1 About

The scaletextbullet package enables the user to resize the \textbullet without moving its vertical center, unlike direct usage of the LaTeX 2_ε and expl3 commands \scalebox and \box_scale:. This process is not fully automated—the user must use \settextbulletfactor to set the \textbullet factor to the correct value to display the resized \textbullet at the correct height. The \textbullet factor is the ratio of the width of the \textbullet, excluding its empty space, to its width, including its empty space. One way of estimating the \textbullet factor is by using \scaletextbulletdebug.

This package provides a solution that works only in text mode. For a solution that works only in math mode, see the linked TeX Stack Exchange thread.[1]

1.2 Loading the package

Requirements:
- LaTeX 2_ε version 2023-11-01 or newer
- l3kernel version 2023-10-10 or newer

scaletextbullet does not load or require any other packages.

1.3 Syntax

This documentation uses the syntaxes ⟨*floating point expression*⟩ and ⟨*integer expression*⟩. These syntaxes have the same meaning as the arguments to \fpeval and \inteval, respectively, which are documented in usrguide.

2 Commands

```
\settextbulletfactor {⟨floating point expression⟩}
```

Sets the \textbullet factor to the result of evaluating the ⟨*floating point expression*⟩. The \textbullet factor is the ratio of the width of the \textbullet, excluding its empty space, to its width, including its empty space. The scope of the effect is local to the current group. The initial \textbullet factor is 0.4—this matches the dimensions of the \textbullet of the Latin Modern font at size 10 pt.

---

1. https://tex.stackexchange.com/questions/119319/how-to-correctly-shrink-the-bullets-of-itemize

```
\scaletextbullet {⟨floating point expression⟩}
```

Prints a \textbullet with its size scaled by a factor equal to the result of evaluating the ⟨*floating point expression*⟩. The new \textbullet will be printed with the same vertical center only if the \textbullet factor is set to the correct value.

Some exceptions:

- Issues an error if the result of evaluating the ⟨*floating point expression*⟩ is a negative number.
- Issues a warning if the new \textbullet would have zero dimensions.
- Cannot be used in math mode.

```
\scaletextbullets [⟨floating point expression⟩] {⟨integer expression⟩}
```

Prints a number of \textbullets equal to the result of evaluating the ⟨*integer expression*⟩ with about the same total area as the original \textbullet.[2] Adding the optional argument instead scales the size of each \textbullet by a factor equal to the result of evaluating the ⟨*floating point expression*⟩. The new \textbullet will be printed with the same vertical center only if the \textbullet factor is set to the correct value.

Some exceptions:

- Issues an error if the result of evaluating the ⟨*integer expression*⟩ or ⟨*floating point expression*⟩ is a negative number.
- Issues a warning if no \textbullets would be printed.
- Issues a warning if the new \textbullet would have zero dimensions.
- Cannot be used in math mode.

```
\scaletextbulletdebug
```

This command is provided only to help the user estimate the \textbullet factor. Prints 15 consecutive \textbullets with decreasing sizes. The \textbullets are followed by the original \textbullet inside a framed box. The framed box has width equal to the \textbullet factor × the total width of the \textbullet (this includes its empty space). The \textbullet factor is set to the correct value when the 15 consecutive \textbullets have the same vertical center and the \textbullet fits nicely inside the framed box. Cannot be used in math mode.

3   Application

I wrote this package primarily to create nicer-looking itemized lists. The default list labels in LaTeX (and other programs) fail to communicate the list level within the list hierarchy:

---

2. In calculating the total area, I have approximated each \textbullet as a perfect circle, but, of course, the actual shape depends on the font used.

- List level 1
  - List level 2
  - List level 2
    * List level 3

- List level 1
  - List level 2
    * List level 3
    * List level 3

This contrasts with traditional enumerated list structures where the list level is obvious from the numbering of the list label:

1. List level 1
   1.1. List level 2
   1.2. List level 2
        1.2.1. List level 3

2. List level 1
   2.1. List level 2
        2.1.1. List level 3
        2.1.2. List level 3

This package allows the user to create nice-looking itemized lists using `\scaletextbullets`:

- List level 1
  ·· List level 2
  ·· List level 2
     ··· List level 3

- List level 1
  ·· List level 2
     ··· List level 3
     ··· List level 3

The visual effect may be more clear with different fonts. This example uses STIX Two Text and Source Serif 4, respectively.

- List level 1
  ·· List level 2
  ·· List level 2
     ··· List level 3

- List level 1
  ·· List level 2
     ··· List level 3
     ··· List level 3

- List level 1
  ·· List level 2
  ·· List level 2
     ··· List level 3

- List level 1
  ·· List level 2
     ··· List level 3
     ··· List level 3

4 Implementation notes

The procedure of resizing the `\textbullet` without changing its vertical center, including the definition of the `\textbullet` factor, makes an important assumption: That the `\textbullet` is a perfect circle. Of course, this is not completely accurate and the actual shape depends on the font used. This means that the `\textbullet` factor may not be exactly the ratio of the width

of the `\textbullet`, excluding its empty space, to its width, including its empty space.

In writing this package, I have referenced a comment on the TeX Stack Exchange by the user egreg.[3] This package uses the same procedure for resizing the `\textbullet` without changing its vertical center.
